

# ES75 - Project Assignment

- Take a look at the Kirsch Building and think about the equipment and processes that consume energy, specifically electricity.
- Organize these processes into different categories that make sense to you. Could be importance or could be amount of energy consumption, etc....
- Estimate the amount of energy used by each of the processes. You are free to make educated guesses or use averages for this building type available from any number of sources.
- Create a document which conveys this information. Be creative. Imagine you are going to make a presentation to a board of directors describing how a facility uses energy/power. They want the big picture with supporting data.
- Make a list of recommendations using what you know about the facility. In addition and if you can't think of any, make a list of the features of the building that stand out to you as unique when considering energy consumption.
