

Climate & Biogeography

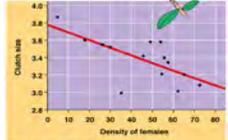

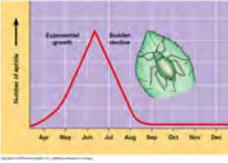

Factors that Limit Species Distribution

- Abiotic (nonliving) Limiting Factors**
 - Temperature
 - Water
 - Soil type
 - Sunlight
 - Salinity
 - Wind stress
 - Altitude, depth
- Biotic (living) Limiting Factors**
 - Food source
 - Competition
 - Predators
 - Social factors, mates
 - Pathogens, parasites
 - Vegetation

Factors that Limit Species Distribution

- Density Dependent Limiting Factors**
 - Limited resources
 - Food
 - Water
 - Safe refuge
 - Predation
 - Competition
 - Living space
 - Disease, Pollution
- Density Independent Limiting Factors**
 - Natural disasters
 - Hurricanes
 - Floods, landslides, volcanoes
 - Drought, frost
 - Environmental insult
 - Deforestation
 - Pesticide
 - Fire
 - Climatic change

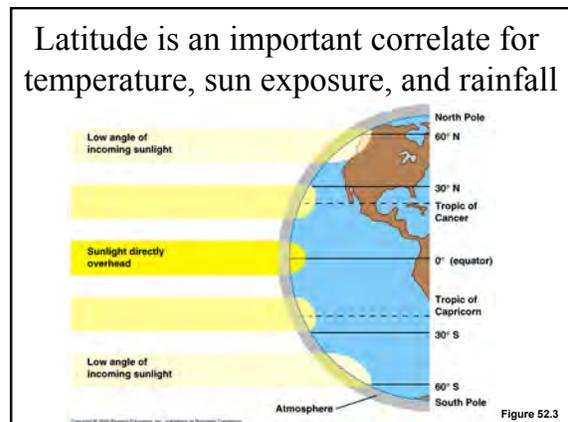

Climate

- The prevailing weather conditions in a particular area
- Four major abiotic components:
 - Temperature, water, sunlight, and wind

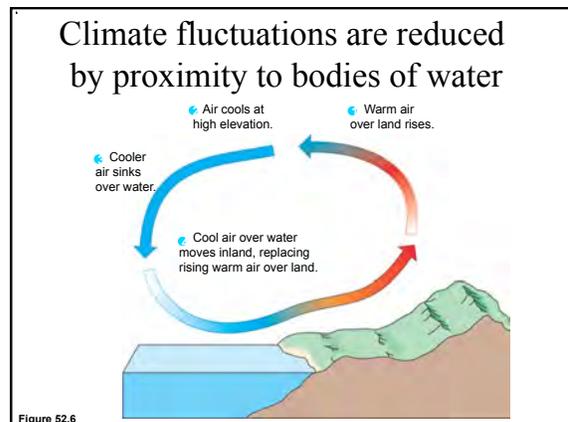

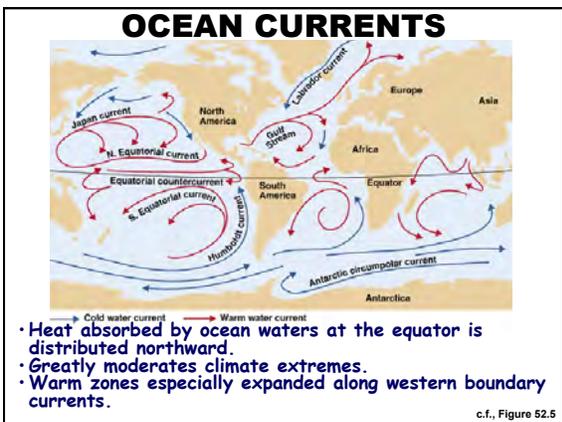

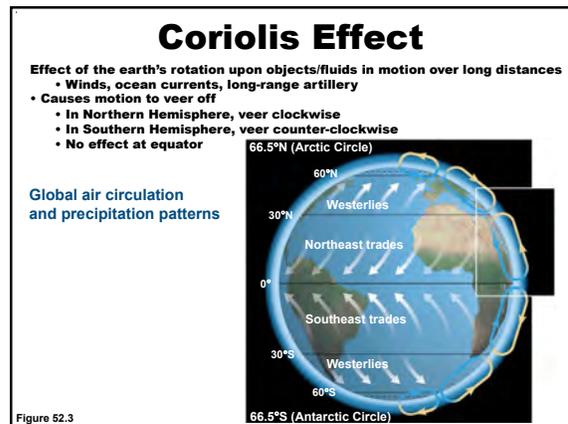

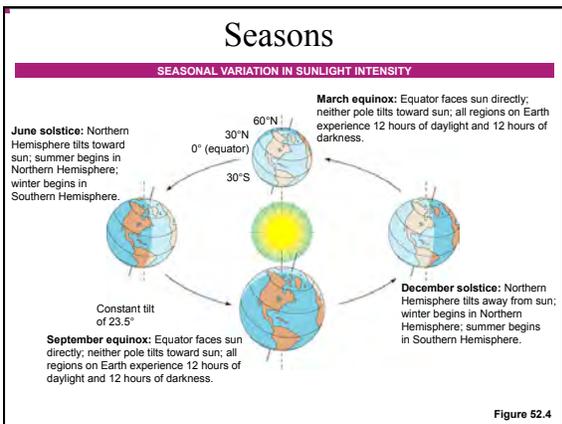

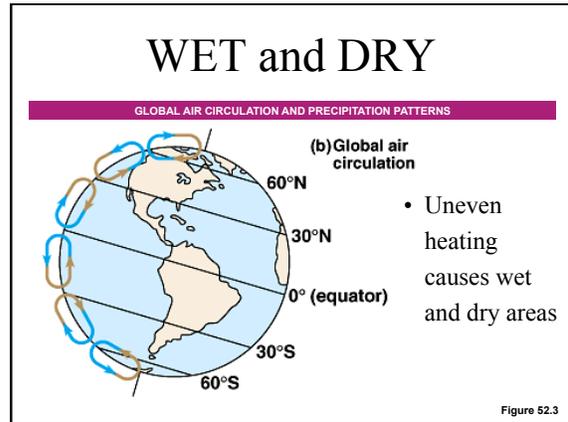

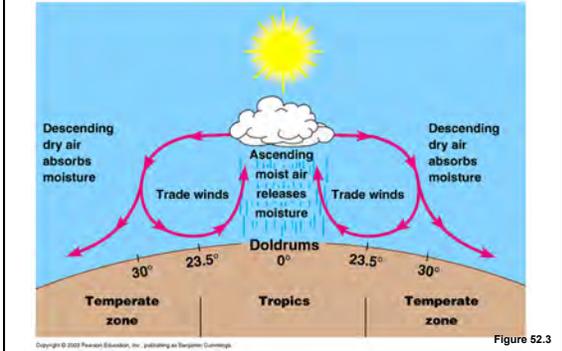

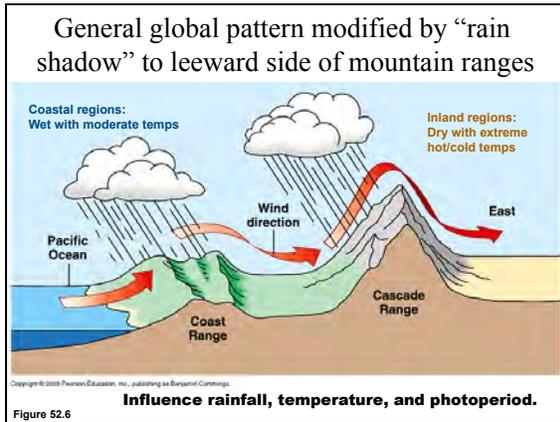

- Macroclimate: patterns on global & regional scales
- Microclimate: very fine, small-scale patterns
 - scale determined by size & mobility of the organisms
 - e.g., conditions encountered by the community of organisms underneath a fallen log

Climate & Biogeography

The equator receives maximal solar heating producing predictable patterns of wind and rainfall

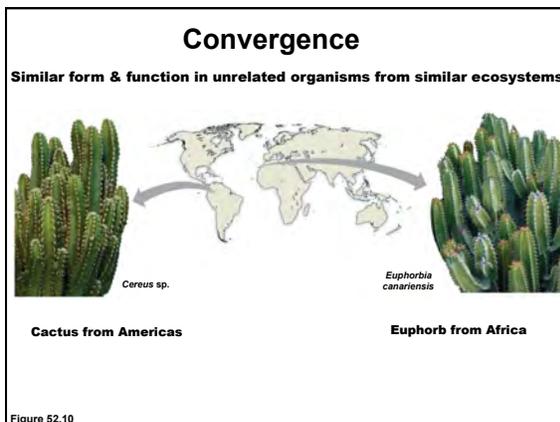

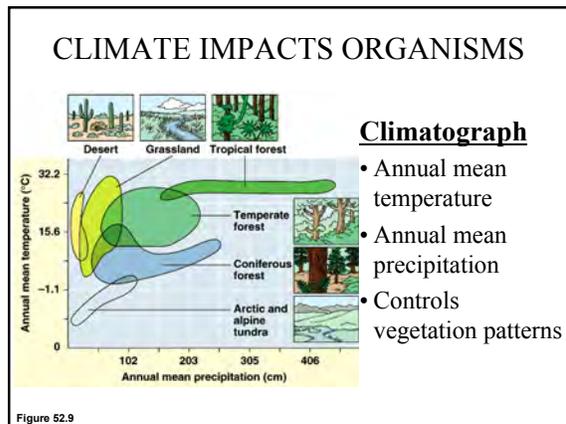

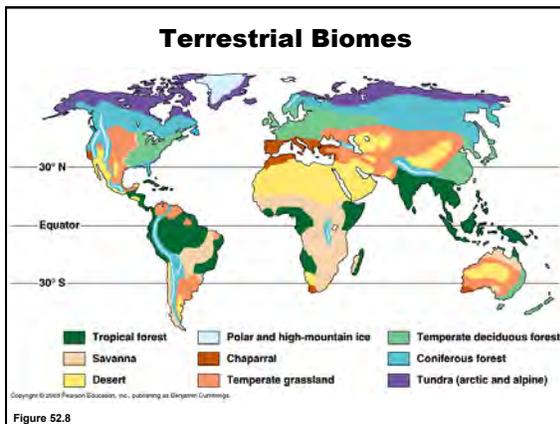

Biomes: the major types of ecosystems

Terrestrial biomes

- Primary determining factors
 - Temperature (latitude, altitude)
 - Water availability (rainfall)
- Secondary determining factors
 - Substrate (soil type)
 - Photoperiod (latitude again)
 - Wind (evaporative cooling, physical stress)
 - Disturbance (fire, volcano, mudslide, storm, etc.)

TROPICAL FORESTS

- Warm, stable temperature
- 100+ inches of rain
 - Rain forest: consistent
 - Dry forest: seasonal
- Low nutrient soils
- Rapid decomposition and recycling
- Most complex
 - Patchy & stratified
- High diversity

SAVANNA BIOME

- Warm temperature
- Low but consistent rainfall
- Less structure and diversity
- Fire and grazing prevent tree invasion

DESERT BIOME

- Temperature extremes
- Precipitation infrequent
- Evaporation exceeds precipitation
 - Life keyed to rainfall
 - Adaptations for water conservation
- 30° north and south
- Rain shadow

CHAPARRAL BIOME

- “Mediterranean climate”
- Cool offshore currents
- Mild rainy winters
- Long hot summers
- Frequent fires
- Vegetation adapted to fire

TEMPERATE GRASSLANDS

- Cold winters
- Seasonal drought
- Occasional drought
- Grazing and fire
- Prevent invasion by shrubs and trees
- Deep fertile soils
- Human impact

TEMPERATE DECIDUOUS (BROADLEAF) FOREST

- 35° to 50° north and south
- Ample precipitation
- Warm summers and cold winters
- Deciduous vegetation
- Rich soils
- Many human impacts

CONIFEROUS FORESTS

Largest terrestrial biome

- Short summers
- Harsh winters
- Poor soils
- Cone bearing trees
- Fire maintained
- Temperate rain forests in northwestern North America

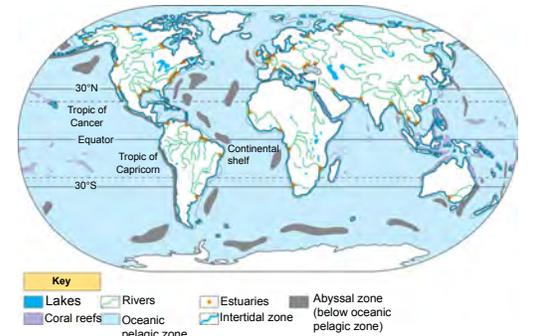

TUNDRA BIOME

- Northern latitudes
- Alpine regions above treeline
- Short, warm summers
- Long, bitter cold winters
- Permafrost
- Low growing vegetation

Aquatic Biomes

>75% of Earth's surface

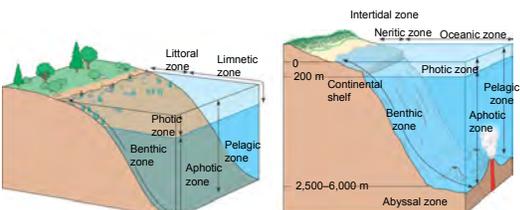

Key

- Lakes
- Rivers
- Estuaries
- Abyssal zone (below oceanic pelagic zone)
- Coral reefs
- Oceanic pelagic zone
- Intertidal zone

Stratification of aquatic biomes

- Many aquatic biomes are stratified into zones (layers) defined by light penetration, temperature, and depth

(a) Zonation in a lake. (b) Marine zonation.

Figure 52.12

LAKES

- Oligotrophic: few nutrients → few producers → clear water
- Eutrophic → abundant nutrients → abundant phytoplankton → murky, green water

Oligotrophic lake in Grand Teton, Wyoming Eutrophic lake in Okavango delta, Botswana

LAKES

- Lakes are sensitive to seasonal temperature change
 - Often experience seasonal turnover

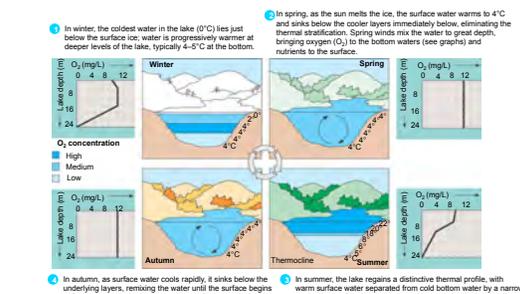

Figure 52.13

WETLANDS

- Alternate between aquatic and terrestrial

Okefenokee National Wetland Reserve in Georgia

ESTUARIES

- Transition between freshwater and marine

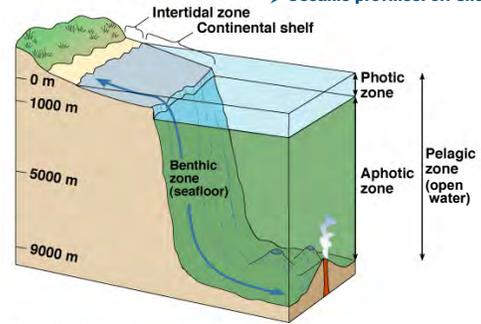

An estuary in a low coastal plain of Georgia

OCEAN ZONES

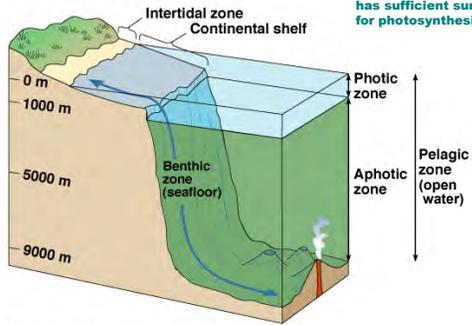

Neritic province: over shelf

Oceanic province: off shore

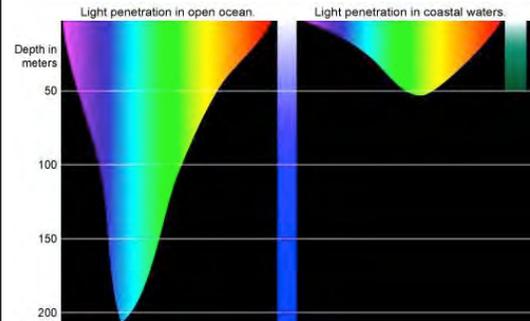

OCEAN ZONES

Only top 2% of ocean has sufficient sunlight for photosynthesis.

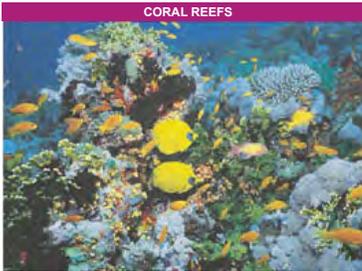

Light absorption & penetration in the sea

TROPICAL NERITIC BIOME

- Warm, stratified, oligotrophic waters
- Coral reefs — “oases in the desert”

Coral reef in the Red Sea

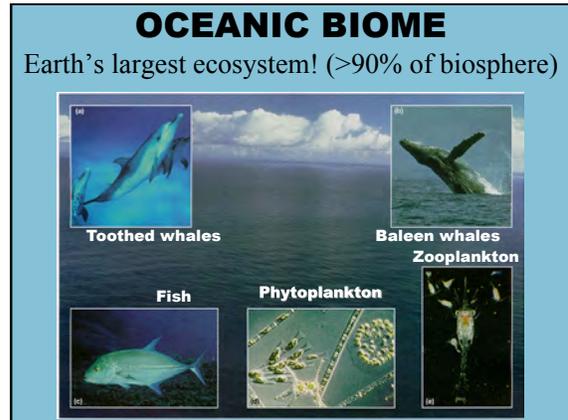

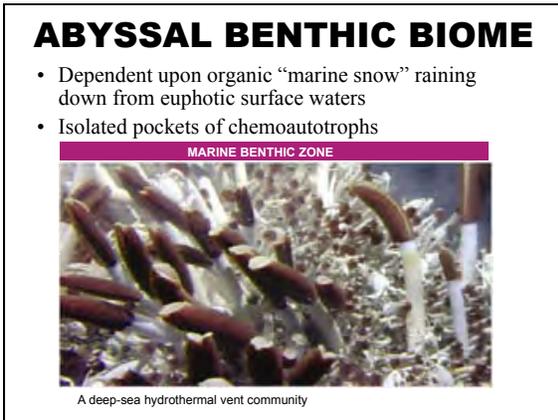

TEMPERATE NERITIC BIOME

- Cold, eutrophic waters → most productive
- Upwelling: surface water blown offshore; replaced by deep water
- Phytoplankton blooms & kelp forests

< 1% of ocean area, but > 50% of fish productivity

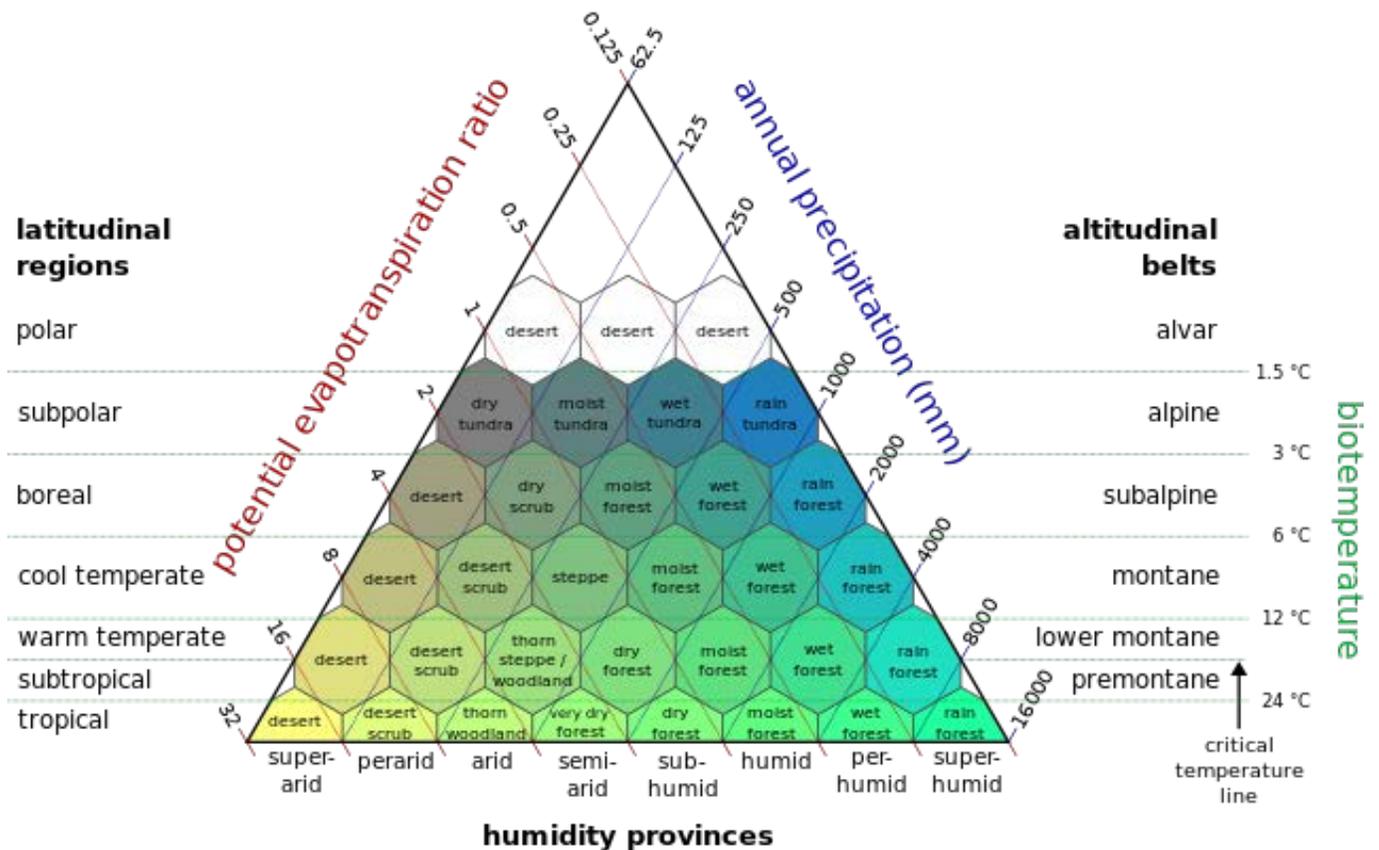

Bull kelp

Holdridge lifezone classification chart
